

Train the dog to the alley tone.

Movement alerts you can hear from the back of the house.

WHY THIS IS USEFUL ON THIS BLOCK

The street is short. The alley is dirt, narrow, and used. People walk it. Cars roll it. Dogs and bikes use it. A window camera is only useful if you are looking at the screen. A chime is useful if you are cooking, in the yard, or in another room. These receivers are clocks with a speaker. Put one near where you actually sit.

PLACEMENT THAT WORKS

- Front tree or mailbox post for street traffic.
- Gate or fence post for the side yard.
- Alley pole or rear fence for the back access.
- Receiver in the back room so front sensors still reach you when you are not at the window.
- Second receiver in the bedroom if you want night coverage at low volume.

DOGS AND SOUND

Pick one melody for alley sensors and a different melody for the street. Play the alley tone while you walk the dog past that sensor a few times. Most dogs map a sound to a direction in a week. The point is not to scare anyone. The point is that property has ears even when you do not.

THE ASK

Each of the 15 addresses from 700 to 900 buys one kit. That puts 30 sensors into a pool. You own your two. You pick six more. We pair on the porch at 721 so nobody has to guess channels. No group chat required. No subscription. If you already own cameras, keep them. This is the audio layer so you do not have to stare at a screen.

Kit: Wuloo Solar Driveway Alarm, 1 receiver + 2 sensors. About \$53.
