

Two sensors in. Six sensors out.

A \$55 kit that lets every house hear movement on the street and the alley.

THE DEAL IN PLAIN ENGLISH

Buy the Wuloo solar driveway kit. One indoor receiver and two outdoor solar motion sensors. About \$53 to \$55 on Amazon. Search Wuloo Solar Driveway Alarm 1800ft.

You keep and place your two sensors wherever you choose. Driveway. Gate. Tree. Alley pole. Your property. Those two belong to you.

You add those two sensors to a shared street pool. In exchange, your receiver can be taught six more sensors that other houses put up. Official limit is eight sensors per receiver. Your two plus six from the pool.

Want more coverage? Buy another receiver. Two receivers can listen to sixteen sensors. Four receivers can listen to thirty-two. That covers a thirty-sensor block.

WHY ONE SENSOR CAN WAKE THE WHOLE STREET

These units do not use Wi-Fi, an app, or a locked account. A sensor that sees motion sends a short wireless ping on a shared radio band. Pairing is just teaching a receiver which ping to listen for. Once taught, that same sensor can ring every receiver on the block. There is no exclusivity. One transmitter, unlimited receivers.

DOGS, VOLUME, AND WHERE THE BOX SITS

Give the alley sensors a loud, distinct chime. Dogs learn tones. A trained dog is extra ears when you are in the shower or in the back yard. Put one receiver toward the back of the house so front and alley sensors still reach you. Turn volume down at night. Mute when you need quiet. Each receiver has its own volume.

721 mailbox tree. Same Wuloo unit.

WHAT YOU DO THIS WEEK

1. Order the 1-receiver + 2-sensor kit.
2. Charge both sensors in the sun.
3. Mount your two sensors where you want eyes.
4. Keep the receiver inside. Clock and chime.
5. Tell 721 when they are up. We pair together.
6. Pick six extra sensors from the pool.
7. Train the dog to the alley tone if you want.

Thirty sensors. One radio. No app.

How a \$55 driveway alarm becomes a block-wide movement alert.

THE MATH FOR 15 HOUSES ON E. LA SIERRA

\$55

one kit per house

30

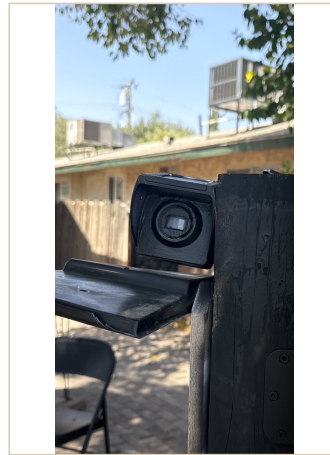

sensors in the pool

8

sensors per receiver

WHAT THE PHOTOS ALREADY SHOW

The brown hooded box on the 721 mailbox tree is a Wuloo solar sensor. The same unit is on the fence post, on a weathered alley pole, and on a neighbor post by the easement wall. Inside the front window at 721 is a nest of receivers and cameras aimed at the street. This flyer is the invitation to stop running that as one house and start running it as a block.

Alley pole sensor, charging port visible. Fence-post sensor already painted in.

HOW PAIRING ACTUALLY WORKS

Put a receiver in pairing mode. Wave a hand in front of a sensor. The receiver learns that sensor and assigns it a channel and a chime. Do the same wave in front of a second receiver and that second house now hears the same sensor. Manuals and owner reviews confirm extra receivers pair to existing sensors. That is the whole trick. Analog-style radio. Motion in, chime out. No cloud. No monthly fee.

WHAT YOU KEEP CONTROL OF

- You choose the two places your sensors sit.
- You choose which six extra sensors your box listens to.
- You choose the chime for each channel so you know alley from driveway.
- You choose volume, mute, and which room the receiver lives in.
- You can add receivers without buying more sensors.

Train the dog to the alley tone.

Movement alerts you can hear from the back of the house.

WHY THIS IS USEFUL ON THIS BLOCK

The street is short. The alley is dirt, narrow, and used. People walk it. Cars roll it. Dogs and bikes use it. A window camera is only useful if you are looking at the screen. A chime is useful if you are cooking, in the yard, or in another room. These receivers are clocks with a speaker. Put one near where you actually sit.

PLACEMENT THAT WORKS

- Front tree or mailbox post for street traffic.
- Gate or fence post for the side yard.
- Alley pole or rear fence for the back access.
- Receiver in the back room so front sensors still reach you when you are not at the window.
- Second receiver in the bedroom if you want night coverage at low volume.

DOGS AND SOUND

Pick one melody for alley sensors and a different melody for the street. Play the alley tone while you walk the dog past that sensor a few times. Most dogs map a sound to a direction in a week. The point is not to scare anyone. The point is that property has ears even when you do not.

THE ASK

Each of the 15 addresses from 700 to 900 buys one kit. That puts 30 sensors into a pool. You own your two. You pick six more. We pair on the porch at 721 so nobody has to guess channels. No group chat required. No subscription. If you already own cameras, keep them. This is the audio layer so you do not have to stare at a screen.

Kit: Wuloo Solar Driveway Alarm, 1 receiver + 2 sensors. About \$53.

Buy two sensors. Hear eight.

Then add receivers until the whole block is in your kitchen.

1 You buy the kit.

One receiver and two solar sensors. About \$55. You own both sensors. You pick both locations.

2 You loan the radio, not the hardware.

Your two sensors stay on your property. Neighbors only learn the ping. They cannot move your box. They cannot turn it off.

3 You collect six more pings.

Official spec is eight sensors per receiver. Your two plus six from the street. Extra receivers multiply that. Two boxes, sixteen sensors. Four boxes, thirty-two.

FACTS THAT SURVIVE A SKEPTICAL NEIGHBOR

- Range on the box is 1800 feet in the open. On this block the distances are a few hundred feet at most.
- Pairing a second receiver to an existing sensor is in the official add-a-receiver steps. Wave at the sensor while the new box is in pair mode.
- Reviews describe whole properties running two or three receivers off the same outdoor sensors, each with its own chime map.
- No Wi-Fi means it still works when the internet is down. No account means nobody can remotely mute your street.
- Solar top-up on the sensor. Indoor receiver on an outlet or three AA cells.

START HERE

Search Amazon for Wuloo Solar Driveway Alarm 1800ft, the 1 receiver and 2 sensor kit. When both sensors are mounted, knock on 721 or leave a note on the porch. We will pair your two into the pool and load six others onto your receiver. Bring the dog if you want the alley tone taught on the spot.
